The two-week-long test — which included preparatory groundwork in Bingen, Washington — comes on the heels of a $5.3 million contract the U.S. Naval Air Systems Command had recently awarded to Logos, to develop more WAMI sensors for Navy and Marine users.

"We are very excited by our recent test aboard the RQ-21A Blackjack," said Doug Rombough, vice president for Business Development at Logos Technologies. "Our ongoing effort to develop an ultra-light WAMI capability for the Blackjack and other small, tactical unmanned aircraft is clearly paying

off."

Logos has created a U.S. military version of BlackKite, currently called Cardcounter, an ultra-light (26 pounds) infrared WAMI system developed by Logos. Despite its low SWaP, BlackKite can detect and track in real time every significant target moving within a city-sized area, giving tactical operators a powerful, hereto unheard of, capability.

In addition, thanks to the WAMI system's multi-modal edge processor — which can store six or more hours of mission data — users on the ground can also access recorded imagery for on-the-fly forensic analysis.

"No military in the world has anything like the Logos WAMI sensor on their tactical unmanned aircraft," said Rombough. "This WAMI system views and records the entire area and can stream multiple real-time and recorded video 'chip-outs' down to handheld devices."

Logos was first tasked with converting their BlackKite system to meet government requirements in September 2019, with two units being produced for the U.S. Naval Air Systems Command. The follow-on $5.3 million development contract and March test flight are part of the same effort.

"In total, we will be producing four modular WAMI systems for the Navy," Rombough said, "with the hope that this will open the door for a wider U.S. military adoption of WAMI, both for the Blackjack and other Group 3 unmanned aircraft."
